

# Destination Inspection Services

## Customized Solutions for Customs Modernization

Destination Inspection services are designed to assist Customs authorities in facing challenges related to the rise in trade volumes worldwide and to the significant increase in illegal trafficking of goods and people. The WTO Agreement and the Kyoto Protocol both place significant emphasis on the simplification and harmonization of Customs procedures to effectively contribute to the development of legitimate international trade.

Combining sophisticated modern technologies such as scanning, computerized risk management and valuation, Cotecna's Destination Inspection scheme represents an effective tool for governments and Customs authorities to facilitate legitimate trade, secure revenue collection and enforce legislation.

As the first inspection company to invest in high-energy cargo scanning technology for Destination Inspection, Cotecna is by far the most experienced and currently the biggest private scanner operator worldwide.

Cotecna proposes a Computerized Risk Management Solution (CRMS®), which is key in targeting high risk cargo for scanning. We also provide valuation, classification and investigation services to assist Customs in validating declared information. Cotecna's network of offices and professionals update Customs valuation databases daily via our ValueQuest® solution.
